

Session 14 – DAX Basics: Short Note

Task 1: Created a calculated column **OrderAmountINR** by multiplying OrderAmount × 83 to convert USD into INR.

DAX Formula:

```
OrderAmountINR = Sales[OrderAmount] * 83
```

Task 2: Created a **TotalLikes** measure using SUM() to calculate total likes from the SocialPosts table.

DAX Formula:

```
TotalLikes = SUM(SocialPosts[Likes])
```

Task 3: Created a Genre slicer and an **Average UserRating** measure using AVERAGE() to show ratings according to the selected genre.

DAX Formula:

```
Average UserRating = AVERAGE(Movies[UserRating])
```

Task 4: Created a calculated column **DiscountedPrice** using Price – Discount and a **TotalDiscountedSales** measure using SUM(); observed how measures change with filters.

DAX Formulas:

```
DiscountedPrice = Products[Price] - Products[Discount]  
TotalDiscountedSales = SUM(Products[DiscountedPrice])
```

Task 5: Studied DAX data types such as Whole Number, Decimal, Text, Date, Boolean, Currency and Percentage, with real-world app examples.
